WHO AM I ?

Louis Moreau (@luisomoreau)

I studied in HEI Lille for 6 years 🤔

I started my career connecting
African rhinoceroses 🐂
@Sigfox (~3 years)

Then, I worked as a **Full-Stack Engineer**
@Goodeed (@KissKissBankBank) (~ 6 months)

After I did some **Technical Marketing Management**
@Scaleway (~1.5 year)

Now am a **User Success Engineer**
@Edge Impulse

AGENDA

Embedded Programming 1/3

- 1. Introduction**
- 2. Microcontrollers**
- 3. Basics of embedded programming**
- 4. Understand an Arduino Program**

Introduction

What is **Embedded Programming**?

Embedded programming is a specific type of programming that supports the creation of consumer facing or business facing devices **that don't operate on traditional operating systems** the way that full-scale laptop computers and mobile devices do. The idea of embedded programming is part of what drives the evolution of the digital appliances and equipment in today's IT markets.

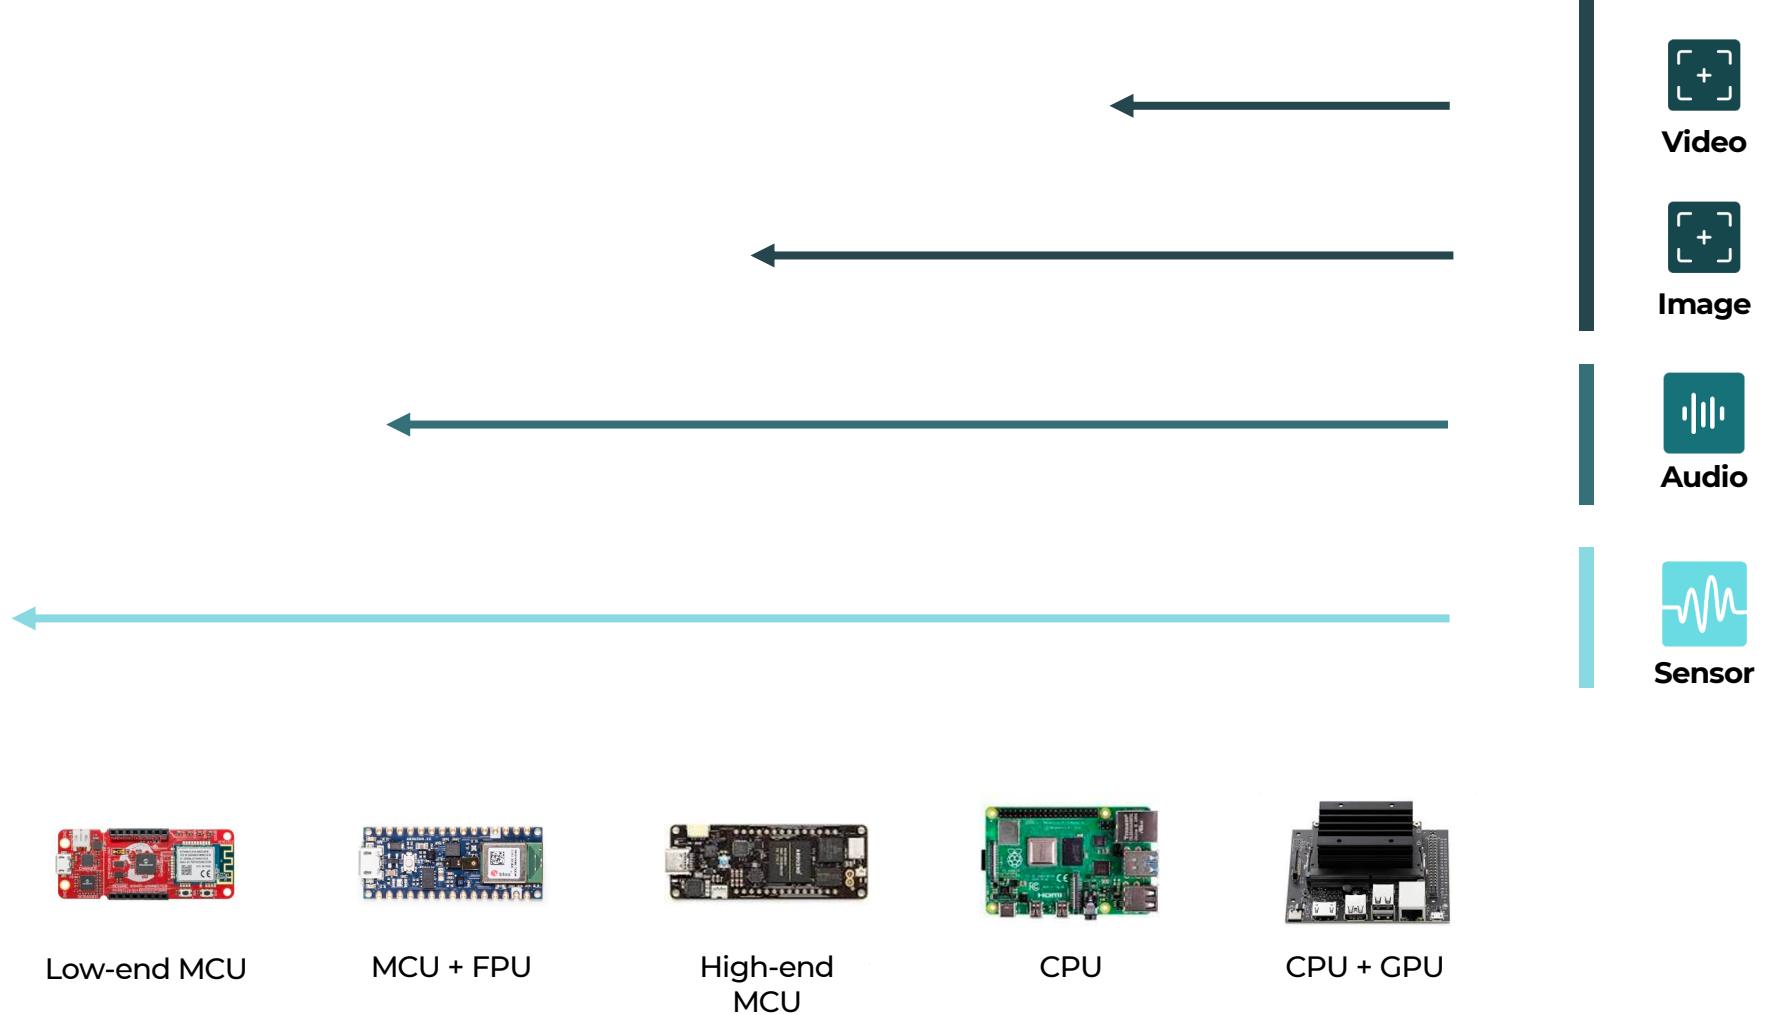

TL;DR

Some experts define embedded programming as the dominant methodology for **microcontroller programming**.

Embedded Programming 1/3

Introduction

Embedded Programming 1/3

1. Introduction

2. Microcontrollers

MCU

What is a microcontroller?

A microcontroller unit (MCU) is a **small, self-contained computer** that is housed on a **single integrated circuit, or microchip**. They differ from your desktop computer in that they are **typically dedicated to a single function**, and are most often embedded in other devices (e.g. cellphones; household electronics, **IoT devices**).

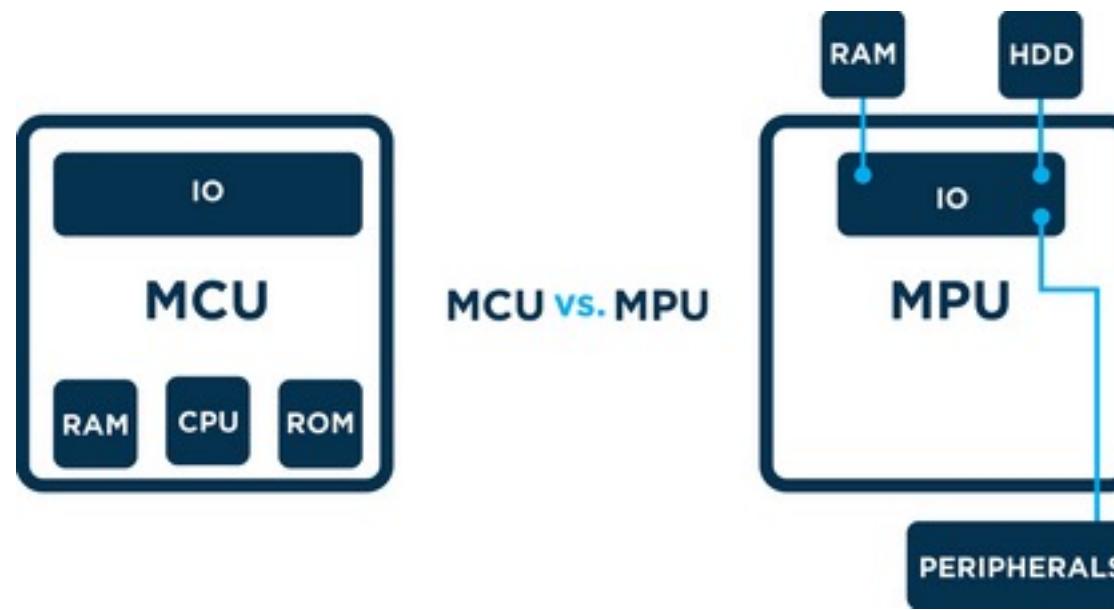

Image source: <https://www.particle.io/>

Embedded Programming 1/3

1. Introduction

2. Microcontrollers

MCU

What are the elements of a microcontroller?

Memory

A microcontroller's memory is used to store the data that the processor receives and uses to respond to instructions that it's been programmed to carry out. A microcontroller has two main memory types:

RAM

Data memory,

which is required for **temporary data storage** while the instructions are being executed. Data memory is volatile, meaning the data it holds is temporary and is only maintained if the device is connected to a power source.

ROM

Program memory,

which stores **long-term information** about the instructions that the CPU carries out. Program memory is non-volatile memory, meaning it holds information over time without needing a power source.

Embedded Programming 1/3

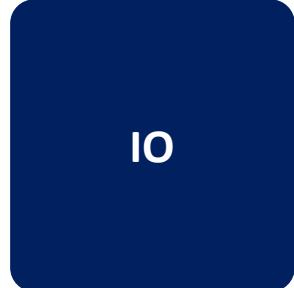

1. Introduction

2. Microcontrollers

MCU

What are the elements of a microcontroller?

I/O Peripherals:

A dark blue rounded rectangle containing the letters "IO" in white.

The **input** and **output** devices are the interface for the processor to the outside world. The input ports receive information and send it to the processor in the form of binary data. The processor receives that data and sends the necessary instructions to output devices that execute tasks external to the microcontroller.

Embedded Programming 1/3

1. Introduction

2. Microcontrollers

MCU main components

ESP-12E Module

The development board equips the ESP-12E module containing ESP8266 chip having Tensilica Xtensa® 32-bit LX106 RISC microprocessor which operates at 80 to 160 MHz adjustable clock frequency and supports RTOS.

ESP-12E Chip

- Tensilica Xtensa® 32-bit LX106
- 80 to 160 MHz Clock Freq.
- 128kB internal RAM
- 4MB external flash
- 802.11b/g/n Wi-Fi transceiver

Embedded Programming 1/3

1. Introduction

2. Microcontrollers

MCU main components

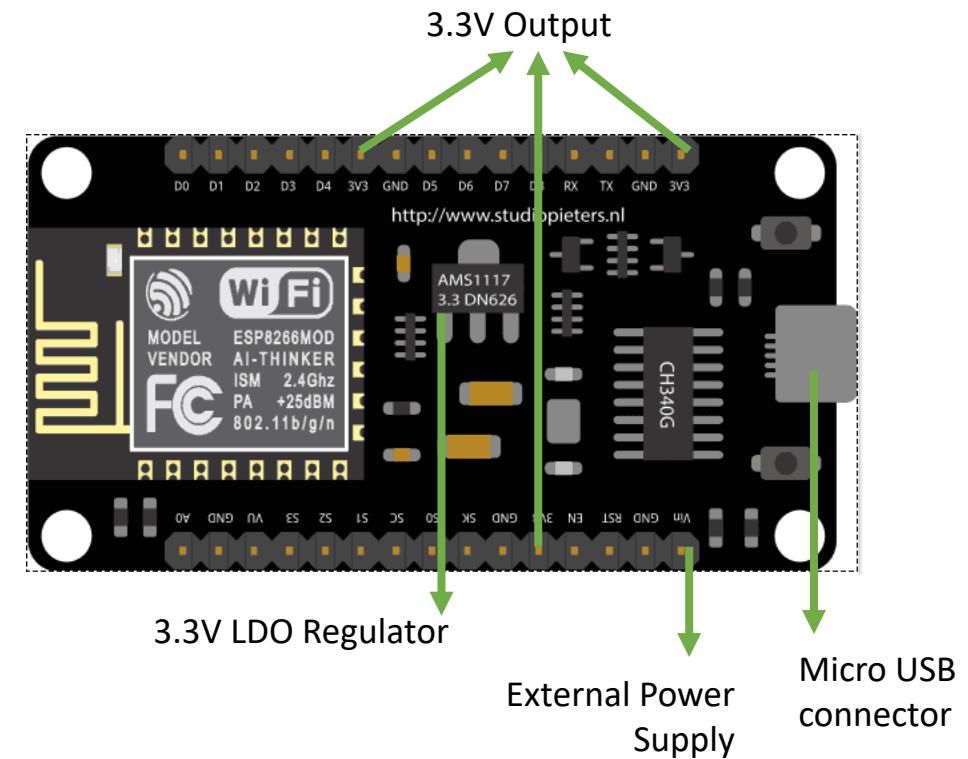

Example with the Nodemcu ESP8266

Power requirement

As the operating voltage range of ESP8266 is **3V to 3.6V**, the board comes with a LDO voltage regulator to keep the voltage steady at 3.3V. It can reliably supply up to 600mA, which should be more than enough when ESP8266 pulls as much as **80mA during RF transmissions**. The board can also supply power to external components (3V3 pin).

Power Requirement

- Operating Voltage: 2.5V to 3.6V
- On-board 3.3V 600mA regulator
- 80mA Operating Current
- 20 µA during Sleep Mode

Embedded Programming 1/3

1. Introduction

2. Microcontrollers

MCU main components

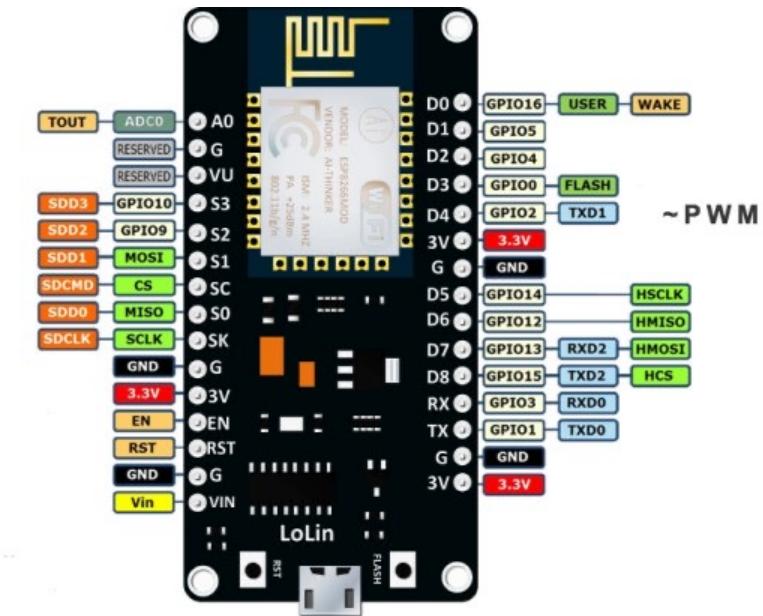

Example with the Nodemcu ESP8266

Peripherals and I/O

The ESP8266 NodeMCU has total 17 GPIO pins broken out to the pin headers on both sides of the development board. These pins can be assigned to all sorts of peripheral duties.

Multiplexed I/Os

- 1 ADC channels
- 2 UART interfaces
- 4 PWM outputs
- SPI, I2C & I2S interface

Embedded Programming

Programming Languages: [MicroPython](#)

MicroPython is a lean and efficient implementation of the [Python 3](#) programming language that includes a small subset of the Python standard library and is optimised to run on microcontrollers and in constrained environments.

Code example 1

```
import pyb  
# turn on an LED  
pyb.LED(1).on()  
# print some text to the serial console  
print('Hello MicroPython!')
```

Embedded Programming

Programming Languages: [MicroPython](#)

Code example 2 (blink)

```
from machine import Pin
# create an I/O pin in output mode
p = Pin('X1', Pin.OUT)
# toggle the pin
p.high()
p.low()
import time
while True:
    led.high()
    time.sleep(0.5)
    led.low()
    time.sleep(0.5)
```

Embedded Programming 1/3

1. Introduction

2. Microcontrollers

3. Basics of Embedded Programming

Embedded Programming

Programming Languages: C

C is a powerful general-purpose programming language. It can be used to develop software like operating systems, databases, compilers, and so on.

Code example 1 (with a STM32Cube microcontroller)

```
/* Infinite loop */

// GPIO_PIN_SET => 1
// GPIO_PIN_RESET => 0

static unsigned short pin_state = 0;

while (1) {
    /* USER CODE END WHILE */
    /* USER CODE BEGIN 3 */

    pin_state = !pin_state;

    // write pin state
    HAL_GPIO_WritePin(LED1_GPIO_Port, LED1_Pin, pin_state);

    // synchronous delay for 500 ms
    HAL_Delay(500);
}
```

Embedded Programming

Programming Languages: [Assembly](#)

Assembly language is a **low-level programming language** for a computer or other programmable device specific to a particular computer architecture in contrast to most high-level programming languages, which are generally portable across multiple systems. Assembly language is converted into executable machine code by a utility program referred to as an assembler.

Code example

```
main:  
    sbi 0x04, 5          ; PORTB5 output  
loop:  
    sbi 0x05, 5          ; main loop begin  
    call delay_1000ms     ; PORTB5 high  
    cbi 0x05, 5           ; delay 1s  
    call delay_1000ms     ; 5 PORTB5 low  
    rjmp loop              ; delay 1s  
    ; main loop  
  
delay_1000ms:             ; subroutine for 1s delay  
    ; initialize counters  
    ldi r18, 0xFF          ; 255  
    ldi r24, 0xD3          ; 211  
    ldi r25, 0x30          ; 48  
inner_loop:  
    subi r18, 0x01          ; 1  
    sbci r24, 0x00          ; 0  
    sbci r25, 0x00          ; 0  
    brne inner_loop  
    ret
```

Embedded Programming

Programming Languages: C++ / Arduino

The Arduino language is a **subset of C/C++**, where you can also use assembly for ultra-low level code. Due to their simplicity, the programs you write using the Arduino IDE are called **sketches**.

A compiler is used to transform code into object files.

Code example

```
int LED =13; // The digital pin to which the LED is connected

void setup ( ) {
pinMode (LED, OUTPUT); //Declaring pin 13 as output pin
}

void loop( ) // The loop function runs again and again
{

digitalWrite (LED, HIGH); //Turn ON the LED
delay(1000); //Wait for 1sec

digitalWrite (LED, LOW); // Turn off the LED
delay(1000); // Wait for 1sec

}
```

Arduino IDE

The screenshot shows the Arduino IDE interface with the title bar "Blink | Arduino 1.8.13". The code editor displays the "Blink" sketch, which is a standard example for an ESP8266. The code is as follows:

```
/*
 * ESP8266 Blink by Simon Peter
 * Blink the blue LED on the ESP-01 module
 * This example code is in the public domain

The blue LED on the ESP-01 module is connected to GPIO1
(which is also the TXD pin; so we cannot use Serial.print() at the same time)

Note that this sketch uses LED_BUILTIN to find the pin with the internal LED
*/

void setup() {
    pinMode(LED_BUILTIN, OUTPUT);      // Initialize the LED_BUILTIN pin as an output
}

// the loop function runs over and over again forever
void loop() {
    digitalWrite(LED_BUILTIN, LOW);    // Turn the LED on (Note that LOW is the voltage level
    // but actually the LED is on; this is because
    // it is active low on the ESP-01)
    delay(1000);                    // Wait for a second
    digitalWrite(LED_BUILTIN, HIGH);   // Turn the LED off by making the voltage HIGH
    delay(2000);                    // Wait for two seconds (to demonstrate the active low LED)
}
```

Arduino IDE – Serial Monitor

The screenshot shows the Arduino IDE interface. The top bar displays "Blink | Arduino 1.8.13". The code editor contains the following sketch:

```
void setup() {
  pinMode(LED_BUILTIN, OUTPUT);      // Initialize the LED_BUILTIN pin as an output
  Serial.begin(9600);
}

// the loop function runs over and over again forever
void loop() {
  Serial.println("Turning the LED up");
  digitalWrite(LED_BUILTIN, LOW);    // Turn the LED on (Note that LOW is the voltage level
  // but actually the LED is on; this is because
  // it is active low on the ESP-01)
  delay(1000);                      // Wait for a second
  Serial.println("Turning the LED down");
  digitalWrite(LED_BUILTIN, HIGH);   // Turn the LED off (HIGH is the voltage level)
  delay(2000);                      // Wait for a second
}
```

The bottom half of the window shows the Serial Monitor. It has two panes. The left pane shows the upload process:

```
Uploading stub...
Running stub...
Stub running...
Configuring flash size...
Auto-detected Flash size: 4MB
Compressed 266384 bytes to 196336...
Wrote 266384 bytes (196336 compressed) at 0x0000
Hash of data verified.

Leaving...
Hard resetting via RTS pin...
```

The right pane shows the serial output from the uploaded sketch, which alternates between "Turning the LED up" and "Turning the LED down". A blue circle highlights the "Send" button in the top right corner of the Serial Monitor window.
